

01

Step

Initialize res and maxEnding with first element of the array.

 $\text{maxEnding} = 2$ $\text{res} = 2$ 

Maximum Subarray Sum using Kadane's Algorithm

02
Step

Extend the maximum subarray ending at the previous element, that is 2 by adding 3 to it.

maxEnding = 5

res = 5

Maximum Subarray Sum using Kadane's Algorithm

03
Step

Extend the maximum subarray ending at the previous element, that is 3 by adding -8 to it.

maxEnding = -3

res = 5

Maximum Subarray Sum using Kadane's Algorithm

04
Step

Since the maximum subarray sum ending at the previous index is negative, it is better to start a new subarray starting from the current element, that is 7.

maxEnding = 7

res = 7

Maximum Subarray Sum using Kadane's Algorithm

05
Step

Extend the maximum subarray ending at the previous element, that is 7 by adding -1 to it.

maxEnding = 6

res = 7

Maximum Subarray Sum using Kadane's Algorithm

06
Step

Extend the maximum subarray ending at the previous element, that is -1 by adding 2 to it.

maxEnding = 8

res = 8

Maximum Subarray Sum using Kadane's Algorithm

07
Step

Extend the maximum subarray ending at the previous element, that is 2 by adding 3 to it.

maxEnding = 11

res = 11

Maximum Subarray Sum using Kadane's Algorithm
